

GRUAS SAEZ was founded in 1965 by Mr. Salvador Sáez, who began the construction of fast-erecting cranes, rapidly becoming industry leader in Spain.

Since 1993 the company SAEZ, thanks to a strong intuition, and led by the current manager Mr. Daniel Cánovas, decided to focus resources towards a new and different type of crane.

Thus the production of the successful series S46 and S 52 began, real warhorses of the brand, they distinguish themselves by the particular reliability, modularity of the elements and the heights attainable.

These peculiar features, immediately met the market consensus, constantly making the demand grow, with a strong diffusion of the product.

Always looking for innovative solutions, aimed at simplifying and reducing assembly time, at the beginning of the decade 2000, Saez begins manufacturing "Flat-top" cranes of the TL and TLS series, cranes without tie-rods, with modular elements and compatible with all models in production, which for performance, size and reliability, again meet the consensus of customers.

Currently the range is very articulated, up to the TLS 80, an 80-Ton load capacity crane with an arm of 80 metres.

In 2015 Saez started the sale of its first luffing jib tower crane, the SL 240.

In 2016, SAEZ presents the first "luffing" hydraulic crane, unique on the market.

Given the growing demand, SAEZ technicians are currently working on the new SLH 300 model, when finished, it will be the largest available hydraulic "luffing" on the market.

The success of the SAEZ crane is mainly due to the great reliability shown over time, in use at high and damp temperatures, of South American and African markets, as well as the more rigid temperatures of Poland and Russia.

GRUAS SAEZ S.L., now a worldwide reference, exports its products to over 30 countries, the merit of this success is due to the intuition of Mr. Daniel Cánovas and the trust reciprocated by customers.
